The book introduces ideas how to make the transport safe, effective and reliable. At first it describes the transportation basics and lists transport related institutions and organizations. Then it presents 10 concepts of the Global Integrated Transport that are in detail explained each in a particular chapter. Next chapters describe ITS - Intelligent Transport Systems, modern transport examples and relevant terms in the glossary. The main idea of the book is to prevent traffic collisions by using large conveyors that will transport intermodal containers and passenger cabins of similar sizes. This solution is more expensive than common transport modes, but the integration with other networks on the covered viaducts for a weather independence provides many benefits that will compensate initial higher costs. Elevated position is also good for generating electricity from solar panels and wind turbines, water turbines can be used near the rivers. Another concept provides advice how such construction can help with recycling and waste management. If water pipeline is included, water can be used by firemen for quenching and by agriculture industry for watering dry land.

Book is written for a wide audience, from industry experts to all technology fans and contains many diagrams, images and tables.
